A Cleveland Clinic research team is first in the United States to offer uterus transplant to a woman suffering from life-threatening uterine factor infertility (UFI) [1,2,3]. These women cannot carry a pregnancy. They were born without a uterus, have lost their uterus, or have a uterus that no longer functions. Surrogacy is not an option in the U.S. for many affected women.

A Novel Solution to Infertility? But it is still considered highly experimental.

A UNIQUE FORM OF TRANSPLANT

• Cleveland Clinic is building on a history of transplant.
• Uterus transplant seems to show potential for treating UFI.

• UFI is an irreversible form of female infertility with limited treatment options.
